

# LOW FREQUENCY LOUDSPEAKERS

**KSI's Low frequency loudspeaker systems** offer unbelievable bass response in compact enclosures. Our optimally vented direct radiating models are designed to provide very smooth extended response to the lowest frequency. Our bandpass systems offer high output with limited frequency response in a very compact package.

**KSI Low frequency loudspeaker systems** are right at home for special effects, audio visual theaters, church organs and any application requiring high output solid bass response. All KSI enclosures are constructed from high density wood panels with extensive internal stiffeners yielding a rigid, tight cabinet, so important for accurate low frequency reproduction.

Your choice is a simple one. **KSI Low frequency loudspeaker systems** offer exceptional performance in a cost effective and ready to use package.
